GROUNDBREAKING GRID ARCHITECTURE for the Enterprise

The IBM XIV Storage System is an innovative, high-end open disk system designed to support key current and future business requirements for a highly available information infrastructure. It's design is a grid of standard Intel/Linux components, connected in any-to-any topology using Gigabit Ethernet. This groundbreaking architecture provides outstanding performance, scalability, and reliability. It is a core component of the IBM Information Infrastructure which helps clients address their needs for availability, security, compliance and retention of information.

REVOLUTIONARY DATA DEDUPLICATION TECHNOLOGY

With market leading data deduplication technology, IBM ProtecTIER helps companies increase backup and recovery performance, optimize storage infrastructure, and meet business resilience objectives.
